Describing data: statistical and graphical methods.

Use the mean to describe the sample with a single value that represents the center of the data. Many statistical analyses use the mean as a standard measure of the center of the distribution of the data. The median and the mean both measure central tendency. But unusual values, called outliers, affect the median less than they affect the mean.

This unit covers some basic methods for graphing distributions of quantitative data like dot plots, histograms, and stem and leaf plots. We'll also explore how to use those displays to compare the features of different distributions.

A scatterplot displays data that is paired by using a horizontal axis (the x-axis), and a vertical axis (the y-axis). The statistical tools of correlation and regression are then used to show trends on the scatterplot. A scatterplot usually looks like a line or curve moving up or down from left to right along the graph with points "scattered" along the line.

Descriptive statistics are used to describe the basic features of the data in a study. They provide simple summaries about the sample and the measures. Together with simple graphics analysis, they form the basis of virtually every quantitative analysis of data. Descriptive statistics are typically distinguished from inferential statistics.

Descriptive Statistics | Research Methods Knowledge Base

Use in statistical analysis. Descriptive statistics provide simple summaries about the sample and about the observations that have been made. Such summaries may be either quantitative, i.e. summary statistics, or visual, i.e. simple-to-understand graphs. These summaries may either form the basis of the initial description of the data as part of a more extensive statistical analysis, or they may be sufficient in and of themselves for a particular investigation.

Bar graphs transform the data into separate bars or columns. Generally, this type of visuals have categories on the x-axis and the numbers on the y-axis. So, you can compare statistical data between different groups. The bar graphs show which category is the largest and which is the smallest one.

When we use descriptive statistics it is useful to summarize our group of data using a combination of tabulated description (i.e., tables), graphical description (i.e., graphs and charts) and statistical commentary (i.e., a discussion of the results). Understanding Descriptive and Inferential Statistics ...

In the world of statistical data, there are two classifications: descriptive and inferential statistics. In a nutshell, descriptive statistics just describes and summarizes data but do not allow us to draw conclusions about the whole population from which we took the sample. You are simply summarizing the data with charts, tables, and graphs.

Descriptive Statistics Examples, Types and Definition

Variance, which illustrates how much of a spread exists in the data. Standard deviation, which illustrates the spread of data relative to the mean. Measures of spread are often visually represented in tables, pie and bar charts, and histograms to aid in the understanding of the trends within the data.

Descriptive vs. Inferential Statistics - ThoughtCo

Graphical displays complement tabular presentations of descriptive statistics. Generally, graphs are better suited than tables for identifying patterns in the data, whereas tables are better for providing large amounts of data with a high degree of numerical detail.
