Components. The main component of the extracellular fluid (ECF) is the interstitial fluid, or tissue fluid, which surrounds the cells in the body. The other major component of the ECF is the intravascular fluid of the circulatory system called blood plasma. The remaining small percentage of ECF includes the transcellular fluid. These constituents are often called fluid compartments.

A joint or articulation (or articular surface) is the connection made between bones in the body which link the skeletal system into a functional whole. They are constructed to allow for different degrees and types of movement. Some joints, such as the knee, elbow, and shoulder, are self-lubricating, almost frictionless, and are able to withstand compression and maintain heavy loads while still ...

Respiratory groups. The respiratory centre is divided into three major groups, two in the medulla and one in the pons. The two groups in the medulla are the dorsal respiratory group and the ventral respiratory group. In the pons, the pontine respiratory group is made up of two areas - the pneumotaxic centre and the apneustic centre. The dorsal and ventral medullary groups control the basic ...

The abdominal wall surrounds the abdominal cavity, providing it with flexible coverage and protecting the internal organs from damage. It is bounded superiorly by the xiphoid process and costal margins, posteriorly by the vertebral column and inferiorly by the pelvic bones and inguinal ligament.. The abdominal wall can be divided into two sections: anterolateral and posterior abdominal walls.

El fluido extracelular proporciona el medio para el intercambio de sustancias entre el ECF y las células, y esto puede tener lugar mediante la disolución, mezcla y transporte en el medio fluido.
[12] Las sustancias en el ECF incluyen gases disueltos, nutrientes y electrolitos, todos necesarios para mantener la vida.
[13] El ECF también contiene materiales secretados por las células en ...
